

RECOMMENDED EXPERIENCE TYPE

 **Simulate**

Step Into It: cross-cultural communication

Why this type: You want students leaving able to understand this well enough to walk someone else through it; competence in this field looks like translating complexity; you want them holding a conclusion with its evidence.

Simulate means participants build an immersive experience that teaches someone else.

LENGTH

50 minutes · 5 phases

TEAMS

DOMINANT LITERACY

Understanding AI

DOMINANT PILLAR

Pillar 1 — Purposeful Use

READ THESE FIRST

CLOSE CALL

Only 1.5 points separate Simulate and Research. Read both framings below before committing — this topic genuinely supports either.

How the four types scored

Your answers point most strongly at one type, and the runner-up is a real option rather than a leftover. Both framings teach a transferable AI skill.

Simulate		5.0
Research		3.5
Create		1.5
Challenge		-1.5

THE RUNNER-UP — RESEARCH

Tag it Research if there is a real anchor to verify against — the artifact becomes a conclusion plus its evidence trail, never a summary.

TWO RULES THAT OVERRIDE ANY SCORE

No real clock, no Challenge. A countdown on a verification activity is decoration, not a mechanic — if the audit survives without the timer, it is Research. **And if the artifact is for someone else to move through, it is Simulate, not Create:** a Create artifact is for the maker, a Simulate artifact is for a learner.

THE ACTIVITY

What students actually do

Teams use the documents to build a walkthrough of cross-cultural communication from inside one person's experience, hour by hour, that a reader can move through and feel.

How it runs

1. Teams start inside the documents on cross-cultural communication — establishing what each source actually claims before using any of it.
2. AI reconstructs the texture in minutes: what happens when, what it looks like, what gets said. Far more detail than a team could build alone.
3. Then somebody spots a detail that is wrong, and the session turns: their knowledge is what makes the journey trustworthy.

They leave with

An hour-by-hour journey through cross-cultural communication, built from the documents, with the team's correction log attached.

NOT THE ONE YOU PICTURED?

Three activities carry the Simulate tag. They teach the same skill, run on the same phases and timings, and hit the same wow and failure moments — only what students verify or make changes. The first one is marked as a natural fit for the documents; the others will work but need reframing.

The hour-by-hour journey ✓ CHOSEN

Teams use the documents to build a walkthrough of cross-cultural communication from inside one person's experience, hour by hour, that a reader can move through and feel.

Step into the moment

Teams use the documents to reconstruct one single scene where cross-cultural communication is playing out, in enough detail that a newcomer knows what to notice.

The branching path

Teams build a path through cross-cultural communication out of the documents, where the reader makes choices and sees what actually follows from each one.

CONCEPT CARD

The session, in one page

COURSE

IT-520

TOPIC

cross-cultural communication

WHAT HAPPENS NOW

Students would have to write about two different countries and their communication styles

RAW MATERIAL

Documents, written sources, or literature. Phase 1 opens on it: Read into the documents far enough to name what each one actually claims, who wrote it and why, and which parts you cannot verify from the document itself.

TRANSFERABLE SKILL

Directing an AI to generate from inside a situation rather than about it — and using your own subject knowledge to catch where it is wrong.

ARTIFACT

An hour-by-hour journey through cross-cultural communication, built from the documents, with the team's correction log attached.

WOW MOMENT

The AI reconstructs the setting in specific, navigable detail in minutes — the kind of texture a team could not have built alone in an hour. Then someone spots a detail that is wrong, and the second half of the wow lands: their knowledge is what makes it trustworthy.

FAILURE BY DESIGN

The AI will generate something convincing and subtly wrong — the kind of error only a practitioner catches. Plant it deliberately using the faculty-supplied mistake below. If a team misses it, do not correct them; ask the question: does this feel right to you?

PLANT THIS SPECIFIC ERROR

Not knowing how to properly utilize or cite sources and scholarly resources

HUMAN CONTRIBUTION

Subject authority: the student is the only one in the room who can tell where the reconstruction is shallow, out of order, or missing what a real practitioner would never leave out.

ENTRY POINT

Required: a laptop and the topic you already teach. Not required: any coding, any prior AI experience, any paid tool or account. Students use an institutionally approved AI tool of their choice.

SHARE FORMAT

Walk the room through one part of the experience, then one thing AI got wrong that subject knowledge caught. Works in a virtual classroom: screen-share plus one line in chat.

PILLAR 2 — SAFE USE

Approved tools only. No real patient, client, student or employee data goes into any AI tool. If a student wants to use a non-approved tool, they pair with someone who is on an approved one.

PILLAR 4 — ATTRIBUTION

The artifact carries one line: what AI produced, and what the team decided. Reflection question 3 asks for it out loud, in every version of this session.

Phases

#	PHASE	MIN	WHAT STUDENTS DO	UNLOCK WORD
1	Set the world	8	Read into the documents far enough to name what each one actually claims, who wrote it and why, and which parts you cannot verify from the document itself.	—
2	First build pass	10	Have AI generate the journey from inside that person's day — not a summary about it.	build
3	Depth pass	14	Push for specific detail. Correct what is wrong, and log every correction.	deeper
4	Playtest a neighbour's	10	Walk a neighbouring team's journey and flag what rings false in theirs.	playtest
5	Walk and reflect	8	Guide the room through one hour, and one correction you made.	reflect

Roles — teams of 4

- 1. **Builder** — owns the running order: what happens, in what sequence
- 2. **Prompter** — owns the prompt log, and keeps the AI generating from inside the scene
- 3. **Fact-holder** — owns the correction log: every detail AI got wrong
- 4. **Guide** — owns the walkthrough that takes the room through it

AI skill moments — what to watch for

WHEN IT HAPPENS	THE SKILL	WHAT YOU DO
Phase 2, when a team asks the AI <i>*about*</i> the topic instead of <i>*from inside*</i> it	Prompting from inside a scenario	Show the difference live: “describe the ward” versus “you are the charge nurse at 6am, walk me through it.” One line, whole-room.
Phase 3, the first correction a team makes to the AI's world	Using subject knowledge as the accuracy check	Have them log it. The correction log is the evidence they understood the subject, not the build.
Phase 4, playtesting, when a team spots what a neighbour missed	Recognising plausible-but-wrong detail	Ask how they knew. The answer is always experience — say so.

Reflection

1. Where did the AI give you richness you could not have built alone?
2. Where was it too shallow or plain wrong, and how did you know?
3. Name what the AI produced and what you decided. Which of the two mattered more to how this turned out?
4. Where in your own work or study, in the next two weeks, could you use this exact move?

Closing stem, everyone completes it: “The most useful thing I learned about working with AI today was ____, and I could use this when ____.”

SAY THIS AT THE CLOSE

understanding cross cultural communication and that it can be different so you have to be adaptable.

Pacing

If time runs short: halve the “Playtest a neighbour's” phase and cut sharing to three volunteers, everyone else submits one line. Never cut phase 2 (“First build pass”) or the reflection — the wow moment and the skill live there.

If energy is high: add a second playtest round with a naive audience brief: does it still teach the thing when the reader knows nothing?

Paste-ready build prompt

Copy this into your AI tool of choice to draft the full session, or send it to the AI Experience team as a finished brief. Every answer you gave is already in it.

You are designing an SNHU AI Labs session (a "Lab"). Use the SNHU AI Experience framework skill: work through the thirteen components, keep all participant-facing language tool-agnostic (never name a specific AI tool), and deliver the finished session as one self-contained HTML file with a mode chooser, projector stage and participant workboard, per the framework's design system.

This concept came out of a faculty intake. Treat the answers below as fixed inputs and do not re-ask them.

== FACULTY INTAKE ==

Course: IT-520

Topic / unit: cross-cultural communication

What happens in class now: Students would have to write about two different countries and their communication styles

Raw material students work from: Documents, written sources, or literature (referred to throughout as "the documents")

Session length: 50 minutes | Class size: 12-25 | Teams of 4

Students bring lived/professional experience: some

Real clock in this work: no

Faculty's worry about AI here: thinking

Expert-only mistake to plant as the designed failure: Not knowing how to properly utilize or cite sources and scholarly resources

What students should remember a year later: understanding cross cultural communication and that it can be different so you have to be adaptable.

== CONFIRMED DESIGN DECISIONS ==

Experience type: Simulate (participants build an immersive experience that teaches someone else)

ACTIVITY (chosen by the faculty member from three options for this type) – "The hour-by-hour journey": Teams use the documents to build a walkthrough of cross-cultural communication from inside one person's experience, hour by hour, that a reader can move through and feel.

Activity fits the raw material naturally: yes

How the activity runs:

(1) Teams start inside the documents on cross-cultural communication – establishing what each source actually claims before using any of it.

(2) AI reconstructs the texture in minutes: what happens when, what it looks like, what gets said. Far more detail than a team could build alone.

(3) Then somebody spots a detail that is wrong, and the session turns: their knowledge is what makes the journey trustworthy.

Runner-up considered and rejected: Research

AI visibility: embedded (this drops into an existing class, so the AI skill surfaces mainly in reflection) – Lane 2.

Dominant literacy category: Understanding AI | Secondary: Using AI, Thinking with AI
