

## RECOMMENDED EXPERIENCE TYPE

 **Simulate**

# Step Into It: Joins

**Why this type:** You want students leaving able to understand this well enough to walk someone else through it; competence in this field looks like producing work; you want them holding a decision log.

Simulate means participants build an immersive experience that teaches someone else.

### LENGTH

50 minutes · 5 phases

### TEAMS

4 students, 4 roles

### AI VISIBILITY

Embedded (Lane 2 — in class)

### DOMINANT LITERACY

Understanding AI

### DOMINANT PILLAR

Pillar 1 — Purposeful Use

## READ THESE FIRST

### CLOSE CALL

Only 1.0 points separate Simulate and Create. Read both framings below before committing — this topic genuinely supports either.

### PROTECT THE CLEANING STEP

Cleaning is where the judgment lives. Give it five explicit minutes and do not hand teams a pre-cleaned file — the session gets thinner the tidier the data is.

### WORKFORCE-READINESS TEST

This is new territory. These students are still workforce-bound, so substitute close-to-home experience: ask what they have seen as a patient, customer, parent, or employee rather than as a practitioner, and keep the transfer question pointed at the job they are heading toward.

# How the four types scored

Your answers point most strongly at one type, and the runner-up is a real option rather than a leftover. Both framings teach a transferable AI skill.

|           |             |     |
|-----------|-------------|-----|
| Simulate  | <div></div> | 4.5 |
| Create    | <div></div> | 3.5 |
| Challenge | <div></div> | 3.5 |
| Research  | <div></div> | 1.5 |

## THE RUNNER-UP — CREATE

Tag it Create if what you really want is a made thing in their hands — the session's centre shifts from judging to producing.

## TWO RULES THAT OVERRIDE ANY SCORE

**No real clock, no Challenge.** A countdown on a verification activity is decoration, not a mechanic — if the audit survives without the timer, it is Research. **And if the artifact is for someone else to move through, it is Simulate, not Create:** a Create artifact is for the maker, a Simulate artifact is for a learner.

## THE ACTIVITY

### What students actually do

Teams build a path through Joins out of the dataset, where the reader makes choices and sees what actually follows from each one.

#### How it runs

1. Teams start with the raw data on Joins — working out what it actually measures and what has to be cleaned before it can be used at all.
2. AI generates the branches and consequences fast — and one consequence will be plausible and wrong in a way only a practitioner catches.
3. Playtesting is where it lands: a neighbouring team walks the path and finds the branch that does not hold.

#### They leave with

A branching path through Joins, built from the dataset, with real consequences and playtested by another team.

---

## NOT THE ONE YOU PICTURED?

Three activities carry the Simulate tag. They teach the same skill, run on the same phases and timings, and hit the same wow and failure moments — only what students verify or make changes. The first one is marked as a natural fit for the dataset; the others will work but need reframing.

#### The branching path ✓ CHOSEN

Teams build a path through Joins out of the dataset, where the reader makes choices and sees what actually follows from each one.

#### The hour-by-hour journey

Teams use the dataset to build a walkthrough of Joins from inside one person's experience, hour by hour, that a reader can move through and feel.

#### Step into the moment

Teams use the dataset to reconstruct one single scene where Joins is playing out, in enough detail that a newcomer knows what to notice.

## CONCEPT CARD

# The session, in one page

## COURSE

CIS-255: Applied Data Structure and Database

## TOPIC

Joins

## WHAT HAPPENS NOW

pre-class, they watch a lecture and then they do practice problems using MySQL

## RAW MATERIAL

A dataset, results, or records. Phase 1 opens on it: Open the dataset. Before anything else, name what each field actually measures, what is missing or miscoded, and what you would have to clean before trusting one conclusion from it.

## TRANSFERABLE SKILL

Directing an AI to generate from inside a situation rather than about it — and using your own subject knowledge to catch where it is wrong.

## ARTIFACT

A branching path through Joins, built from the dataset, with real consequences and playtested by another team.

## WOW MOMENT

The AI reconstructs the setting in specific, navigable detail in minutes — the kind of texture a team could not have built alone in an hour. Then someone spots a detail that is wrong, and the second half of the wow lands: their knowledge is what makes it trustworthy.

## FAILURE BY DESIGN

The AI will generate something convincing and subtly wrong — the kind of error only a practitioner catches. Plant it deliberately using the faculty-supplied mistake below. If a team misses it, do not correct them; ask the question: does this feel right to you?

### PLANT THIS SPECIFIC ERROR

picking the correct type of join and what field connects the tables

## HUMAN CONTRIBUTION

Subject authority: the student is the only one in the room who can tell where the reconstruction is shallow, out of order, or missing what a real practitioner would never leave out.

## ENTRY POINT

Required: a laptop and the topic you already teach. Not required: any coding, any prior AI experience, any paid tool or account. Students use an institutionally approved AI tool of their choice.

SHARE FORMAT

Walk the room through one part of the experience, then one thing AI got wrong that subject knowledge caught. Works in a virtual classroom: screen-share plus one line in chat.

PILLAR 2 — SAFE USE

Approved tools only. No real patient, client, student or employee data goes into any AI tool. If a student wants to use a non-approved tool, they pair with someone who is on an approved one.

PILLAR 4 — ATTRIBUTION

The artifact carries one line: what AI produced, and what the team decided. Reflection question 3 asks for it out loud, in every version of this session.

KEEP OUT OF IT

subqueries

Phases

| # | PHASE                  | MIN | WHAT STUDENTS DO                                                                                                                                                                      | UNLOCK WORD |
|---|------------------------|-----|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------|
| 1 | Set the world          | 8   | Open the dataset. Before anything else, name what each field actually measures, what is missing or miscoded, and what you would have to clean before trusting one conclusion from it. | —           |
| 2 | First build pass       | 10  | Name the two or three decisions that actually change the outcome, then have AI generate the branches.                                                                                 | build       |
| 3 | Depth pass             | 14  | Push each consequence for accuracy. Fix and log what is wrong.                                                                                                                        | deeper      |
| 4 | Playtest a neighbour's | 10  | Playtest a neighbouring team's path and find the branch that does not hold.                                                                                                           | playtest    |
| 5 | Walk and reflect       | 8   | Walk the room down one branch, and name what you corrected.                                                                                                                           | reflect     |

Roles — teams of 4

- 1. **Builder** — owns the running order: what happens, in what sequence
- 2. **Prompter** — owns the prompt log, and keeps the AI generating from inside the scene
- 3. **Fact-holder** — owns the correction log: every detail AI got wrong
- 4. **Guide** — owns the walkthrough that takes the room through it

AI skill moments — what to watch for

| WHEN IT HAPPENS                                                                              | THE SKILL                                            | WHAT YOU DO                                                                                                                       |
|----------------------------------------------------------------------------------------------|------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------|
| Phase 2, when a team asks the AI <i>*about*</i> the topic instead of <i>*from inside*</i> it | <b>Prompting from inside a scenario</b>              | Show the difference live: “describe the ward” versus “you are the charge nurse at 6am, walk me through it.” One line, whole-room. |
| Phase 3, the first correction a team makes to the AI's world                                 | <b>Using subject knowledge as the accuracy check</b> | Have them log it. The correction log is the evidence they understood the subject, not the build.                                  |
| Phase 4, playtesting, when a team spots what a neighbour missed                              | <b>Recognising plausible-but-wrong detail</b>        | Ask how they knew. The answer is always experience — say so.                                                                      |

## Reflection

1. Where did the AI give you richness you could not have built alone?
2. Where was it too shallow or plain wrong, and how did you know?
3. Name what the AI produced and what you decided. Which of the two mattered more to how this turned out?
4. Where in your own work or study, in the next two weeks, could you use this exact move?

*Closing stem, everyone completes it: “The most useful thing I learned about working with AI today was \_\_\_, and I could use this when \_\_\_.”*

## SAY THIS AT THE CLOSE

knowing how to breakdown the question into what they're attempting to do and recognizing the correct code

## Pacing

**If time runs short:** halve the “Playtest a neighbour's” phase and cut sharing to three volunteers, everyone else submits one line. Never cut phase 2 (“First build pass”) or the reflection — the wow moment and the skill live there.

**If energy is high:** add a second playtest round with a naive audience brief: does it still teach the thing when the reader knows nothing?

## Paste-ready build prompt

Copy this into your AI tool of choice to draft the full session, or send it to the AI Experience team as a finished brief. Every answer you gave is already in it.

You are designing an SNHU AI Labs session (a "Lab"). Use the SNHU AI Experience framework skill: work through the thirteen components, keep all participant-facing language tool-agnostic (never name a specific AI tool), and deliver the finished session as one self-contained HTML file with a mode chooser, projector stage and participant workboard, per the framework's design system.

This concept came out of a faculty intake. Treat the answers below as fixed inputs and do not re-ask them.

== FACULTY INTAKE ==

Course: CIS-255: Applied Data Structure and Database

Topic / unit: Joins

What happens in class now: pre-class, they watch a lecture and then they do practice problems using mySQL

Raw material students work from: A dataset, results, or records (referred to throughout as "the dataset")

Session length: 50 minutes | Class size: 12-25 | Teams of 4

Students bring lived/professional experience: no

Real clock in this work: some

Faculty's worry about AI here: thinking

Expert-only mistake to plant as the designed failure: picking the correct type of join and what field connects the tables

What students should remember a year later: knowing how to breakdown the question into what they're attempting to do and recognizing the correct code

== CONFIRMED DESIGN DECISIONS ==

Experience type: Simulate (participants build an immersive experience that teaches someone else)

ACTIVITY (chosen by the faculty member from three options for this type) – "The branching path":

Teams build a path through Joins out of the dataset, where the reader makes choices and sees what actually follows from each one.

Activity fits the raw material naturally: yes

How the activity runs:

(1) Teams start with the raw data on Joins – working out what it actually measures and what has to be cleaned before it can be used at all.

(2) AI generates the branches and consequences fast – and one consequence will be plausible and wrong in a way only a practitioner catches.

(3) Playtesting is where it lands: a neighbouring team walks the path and finds the branch that does not hold.

Runner-up considered and rejected: Create

AI visibility: embedded (this drops into an existing class, so the AI skill surfaces mainly in reflection) – Lane 2.

Dominant literacy category: Understanding AI | Secondary: Using AI, Thinking with AI

Dominant pillar: Pillar 1 – Purposeful Use | Secondary: Pillar 6 – Growth and Adaptation

Baseline pillars, required: Pillar 2 Safe and Compliant Use – institutionally approved tools only, no real patient/client/student data entered; Pillar 4 Transparency and Attribution – the artifact carries a line stating what AI produced and what the team decided.

Transferable AI skill: Directing an AI to generate from inside a situation rather than about it – and using your own subject knowledge to catch where it is wrong.

Artifact: A branching path through Joins, built from the dataset, with real consequences and playtested by another team.

Wow moment: The AI reconstructs the setting in specific, navigable detail in minutes – the kind of texture a team could not have built alone in an hour. Then someone spots a detail that is wrong, and the second half of the wow lands: their knowledge is what makes it trustworthy.

Failure by design: The AI will generate something convincing and subtly wrong – the kind of error only a practitioner catches. Plant it deliberately using the faculty-supplied mistake below. If a team misses it, do not correct them; ask the question: does this feel right to you?

Tie-in: Faculty's stated worry is students outsourcing the thinking. The role split is the countermeasure: the AI-facing role never makes the final call – a person does, on the record.

Human contribution moment: Subject authority: the student is the only one in the room who can tell where the reconstruction is shallow, out of order, or missing what a real practitioner would never leave out.

Share format: Walk the room through one part of the experience, then one thing AI got wrong that subject knowledge caught. Must work in a virtual classroom: screen-share plus one line in chat.

Entry point – required: a laptop and the topic already being taught. Not required: any coding, any prior AI experience, any paid tool or account. Participants use an institutionally approved AI tool of their choice.

Pacing flexibility – if short: halve the "Playtest a neighbour's" phase and cut sharing to three volunteers, everyone else submits one line. Never cut phase 2 ("First build pass") or the reflection. If energy is high: add a second playtest round with a naive audience brief: does it still teach the thing when the reader knows nothing?

== PHASES (this brief is written for 50 min; 50 / 75 / 90 columns given so the design system's 50-75 toggle can be built directly) ==

1. Set the world – 50min: 8 | 75min: 12 | 90min: 14 – facilitator function: Choose the moment and the person whose view the experience takes.

participant task: Open the dataset. Before anything else, name what each field actually measures, what is missing or miscoded, and what you would have to clean before trusting one conclusion from it. [no unlock word; opening phase]

2. First build pass – 50min: 10 | 75min: 15 | 90min: 18 – facilitator function: Have the AI generate the setting from inside the scenario.

participant task: Name the two or three decisions that actually change the outcome, then have AI generate the branches. [unlock word: build]

3. Depth pass – 50min: 14 | 75min: 20 | 90min: 24 – facilitator function: Push for detail, and correct what the AI got wrong.

participant task: Push each consequence for accuracy. Fix and log what is wrong. [unlock word: deeper]

4. Playtest a neighbour's – 50min: 10 | 75min: 16 | 90min: 20 – facilitator function: Move through another team's experience and flag what rings false.

participant task: Playtest a neighbouring team's path and find the branch that does not hold. [unlock word: playtest]

5. Walk and reflect – 50min: 8 | 75min: 12 | 90min: 14 – facilitator function: Guide the room through one moment, and one correction.

participant task: Walk the room down one branch, and name what you corrected. [unlock word: reflect]

== AI SKILL MOMENTS (what the facilitator watches for) ==

1. Phase 2, when a team asks the AI \*about\* the topic instead of \*from inside\* it -> skill: Prompting from inside a scenario -> facilitator move: Show the difference live: “describe the ward” versus “you are the charge nurse at 6am, walk me through it.” One line, whole-room.
2. Phase 3, the first correction a team makes to the AI's world -> skill: Using subject knowledge as the accuracy check -> facilitator move: Have them log it. The correction log is the evidence they understood the subject, not the build.
3. Phase 4, playtesting, when a team spots what a neighbour missed -> skill: Recognising plausible-but-wrong detail -> facilitator move: Ask how they knew. The answer is always experience – say so.

== ROLES (teams of 4, each with a named deliverable) ==

1. Builder – owns the running order: what happens, in what sequence
2. Prompter – owns the prompt log, and keeps the AI generating from inside the scene
3. Fact-holder – owns the correction log: every detail AI got wrong
4. Guide – owns the walkthrough that takes the room through it

== REFLECTION ==

1. Where did the AI give you richness you could not have built alone?
2. Where was it too shallow or plain wrong, and how did you know?
3. Name what the AI produced and what you decided. Which of the two mattered more to how this turned out?
4. Where in your own work or study, in the next two weeks, could you use this exact move?

Closing stem, every participant completes aloud or in writing: "The most useful thing I learned about working with AI today was \_\_\_\_, and I could use this when \_\_\_\_."

== BUILD NOTES ==

Session slug: joins (broadcast channel snhu-joins-room, localStorage key snhu-joins-proto)

Timing map: use the 50 and 75 columns above as the t50/t75 proportional map required by the design system. The 90-minute column is faculty-facing planning only – do not add a third toggle.

Faculty asked the session to avoid: subqueries

Run the framework's quality checklist before you finish, including the Simulate-specific checks and both baseline pillar checks.

Then produce: (A) the tool-agnostic session HTML, (B) a tool-specific version only if a named tool's capability would meaningfully change the activity, and (C) the build instructions that reproduce it.
