

RECOMMENDED EXPERIENCE TYPE

 **AI Quests**

Step Into It: networking

Why this type: You want students leaving able to make a good call when there is no time to be thorough; competence in this field looks like translating complexity; you want them holding an experience someone else can enter.

AI Quests means participants build an immersive experience that teaches someone else.

LENGTH

50 minutes · 5 phases

TEAMS

4 students, 4 roles

AI VISIBILITY

Embedded (Lane 2 — in class)

DOMINANT LITERACY

Understanding AI

DOMINANT PILLAR

Pillar 1 — Purposeful Use

READ THESE FIRST

ROOM SIZE

Over forty students: teams of four gives ten-plus artifacts. Share time will not fit. Use three volunteer shares plus a written one-line submission from everyone else.

How the four types scored

Your answers point most strongly at one type, and the runner-up is a real option rather than a leftover. Both framings teach a transferable AI skill.

AI Quests		6.0
AI Studio		3.0
AI Arena		3.0
AI Lab		0.0

THE RUNNER-UP — AI STUDIO

Run it as Studio if what you really want is a made thing in their hands — shift the session's centre from judging to producing.

TWO RULES THAT OVERRIDE ANY SCORE

No real clock, no Arena. A countdown on a critique activity is decoration, not a mechanic — that session is really a Lab. **And if the artifact is for someone else to move through, it is Quests, not Studio:** Studio's artifact is for the maker, Quests' artifact is for a learner.

THE ACTIVITY

What students actually do

Teams build a walkthrough of networking from inside one person's experience, hour by hour, that a reader can move through and feel.

How it runs

1. Teams choose whose experience the journey follows and where it starts — a specific person, a specific day.
2. AI reconstructs the texture in minutes: what happens when, what it looks like, what gets said. Far more detail than a team could build alone.
3. Then somebody spots a detail that is wrong, and the session turns: their knowledge is what makes the journey trustworthy.

They leave with

An hour-by-hour journey through networking from one person's perspective, with the team's correction log attached.

NOT THE ONE YOU PICTURED?

Three activities fit AI Quests and this topic. They teach the same skill, run on the same phases and timings, and hit the same wow and failure moments — only what students make changes. Pick the one you can see happening in your room.

The hour-by-hour journey ✓ CHOSEN

Teams build a walkthrough of networking from inside one person's experience, hour by hour, that a reader can move through and feel.

Step into the moment

Teams reconstruct one single scene where networking is playing out, in enough detail that a newcomer knows what to notice.

The branching path

Teams build a path through networking where the reader makes choices and sees what follows from each one.

CONCEPT CARD

The session, in one page

COURSE

Career 101

TOPIC

networking

WHAT HAPPENS NOW

1 on 1 coaching conversations and hosted events to encourage networking skills

TRANSFERABLE SKILL

Directing an AI to generate from inside a situation rather than about it — and using your own subject knowledge to catch where it is wrong.

ARTIFACT

An hour-by-hour journey through networking from one person's perspective, with the team's correction log attached.

WOW MOMENT

The AI reconstructs the setting in specific, navigable detail in minutes — the kind of texture a team could not have built alone in an hour. Then someone spots a detail that is wrong, and the second half of the wow lands: their knowledge is what makes it trustworthy.

FAILURE BY DESIGN

The AI will generate something convincing and subtly wrong — the kind of error only a practitioner catches. Plant it deliberately using the faculty-supplied mistake below. If a team misses it, do not correct them; ask the question: does this feel right to you?

PLANT THIS SPECIFIC ERROR

Students often think its not an important skill and that they think it's a short term need as opposed to a long term goal

HUMAN CONTRIBUTION

Subject authority: the student is the only one in the room who can tell where the reconstruction is shallow, out of order, or missing what a real practitioner would never leave out.

ENTRY POINT

Required: a laptop and the topic you already teach. Not required: any coding, any prior AI experience, any paid tool or account. Students use an institutionally approved AI tool of their choice.

SHARE FORMAT

Walk the room through one part of the experience, then one thing AI got wrong that subject knowledge caught. Works in a virtual classroom: screen-share plus one line in chat.

PILLAR 2 — SAFE USE

Approved tools only. No real patient, client, student or employee data goes into any AI tool. If a student wants to use a non-approved tool, they pair with someone who is on an approved one.

PILLAR 4 — ATTRIBUTION

The artifact carries one line: what AI produced, and what the team decided. Reflection question 3 asks for it out loud, in every version of this session.

Phases

#	PHASE	MIN	WHAT STUDENTS DO	UNLOCK WORD
1	Set the world	8	Choose whose experience the journey follows, and the exact moment it starts.	—
2	First build pass	10	Have AI generate the journey from inside that person's day — not a summary about it.	build
3	Depth pass	14	Push for specific detail. Correct what is wrong, and log every correction.	deeper
4	Playtest a neighbour's	10	Walk a neighbouring team's journey and flag what rings false in theirs.	playtest
5	Walk and reflect	8	Guide the room through one hour, and one correction you made.	reflect

Roles — teams of 4

- 1. **Builder** — owns the running order: what happens, in what sequence
- 2. **Prompter** — owns the prompt log, and keeps the AI generating from inside the scene
- 3. **Fact-holder** — owns the correction log: every detail AI got wrong
- 4. **Guide** — owns the walkthrough that takes the room through it

AI skill moments — what to watch for

WHEN IT HAPPENS	THE SKILL	WHAT YOU DO
Phase 2, when a team asks the AI <i>*about*</i> the topic instead of <i>*from inside*</i> it	Prompting from inside a scenario	Show the difference live: “describe the ward” versus “you are the charge nurse at 6am, walk me through it.” One line, whole-room.
Phase 3, the first correction a team makes to the AI's world	Using subject knowledge as the	Have them log it. The correction log is the evidence they understood the subject, not the

WHEN IT HAPPENS	THE SKILL	WHAT YOU DO
	accuracy check	build.
Phase 4, playtesting, when a team spots what a neighbour missed	Recognising plausible-but-wrong detail	Ask how they knew. The answer is always experience — say so.

Reflection

1. Where did the AI give you richness you could not have built alone?
2. Where was it too shallow or plain wrong, and how did you know?
3. Name what the AI produced and what you decided. Which of the two mattered more to how this turned out?
4. Where in your own work or study, in the next two weeks, could you use this exact move?

Closing stem, everyone completes it: "The most useful thing I learned about working with AI today was ___, and I could use this when ___."

SAY THIS AT THE CLOSE

building relationships is the #1 way to get to where you want to be and it doesn't just start at the conversation because you need to be the brand way before you get to the handshake.

Pacing

If time runs short: halve the "Playtest a neighbour's" phase and cut sharing to three volunteers, everyone else submits one line. Never cut phase 2 ("First build pass") or the reflection — the wow moment and the skill live there.

If energy is high: add a second playtest round with a naive audience brief: does it still teach the thing when the reader knows nothing?

Paste-ready build prompt

Copy this into your AI tool of choice to draft the full session, or send it to the AI Experience team as a finished brief. Every answer you gave is already in it.

You are designing an SNHU AI Experience session. Use the SNHU AI Experience framework: work through the thirteen components, keep all participant-facing language tool-agnostic (never name a specific AI tool), and deliver the finished session as one self-contained HTML file with a mode chooser, projector stage and participant workboard, per the framework's design system.

This concept came out of a faculty intake. Treat the answers below as fixed inputs and do not re-ask them.

== FACULTY INTAKE ==

Course: Career 101

Topic / unit: networking

What happens in class now: 1 on 1 coaching conversations and hosted events to encourage networking skills

Session length: 50 minutes | Class size: 40+ | Teams of 4

Students bring lived/professional experience: yes

Real clock in this work: some

Faculty's worry about AI here: thinking

Expert-only mistake to plant as the designed failure: Students often think its not an important skill and that they think it's a short term need as opposed to a long term goal

What students should remember a year later: building relationships is the #1 way to get to where you want to be and it doesn't just start at the conversation because you need to be the brand way before you get to the handshake.

== CONFIRMED DESIGN DECISIONS ==

Experience type: AI Quests (participants build an immersive experience that teaches someone else)

ACTIVITY (chosen by the faculty member from three options for this type) – "The hour-by-hour journey": Teams build a walkthrough of networking from inside one person's experience, hour by hour, that a reader can move through and feel.

How the activity runs:

(1) Teams choose whose experience the journey follows and where it starts – a specific person, a specific day.

(2) AI reconstructs the texture in minutes: what happens when, what it looks like, what gets said. Far more detail than a team could build alone.

(3) Then somebody spots a detail that is wrong, and the session turns: their knowledge is what makes the journey trustworthy.

Runner-up considered and rejected: AI Studio

AI visibility: embedded (this drops into an existing class, so the AI skill surfaces mainly in reflection) – Lane 2.

Dominant literacy category: Understanding AI | Secondary: Using AI, Thinking with AI

Dominant pillar: Pillar 1 – Purposeful Use | Secondary: Pillar 6 – Growth and Adaptation

Baseline pillars, required: Pillar 2 Safe and Compliant Use – institutionally approved tools only,

no real patient/client/student data entered; Pillar 4 Transparency and Attribution – the artifact carries a line stating what AI produced and what the team decided.

Transferable AI skill: Directing an AI to generate from inside a situation rather than about it – and using your own subject knowledge to catch where it is wrong.

Artifact: An hour-by-hour journey through networking from one person's perspective, with the team's correction log attached.

Wow moment: The AI reconstructs the setting in specific, navigable detail in minutes – the kind of texture a team could not have built alone in an hour. Then someone spots a detail that is wrong, and the second half of the wow lands: their knowledge is what makes it trustworthy.

Failure by design: The AI will generate something convincing and subtly wrong – the kind of error only a practitioner catches. Plant it deliberately using the faculty-supplied mistake below. If a team misses it, do not correct them; ask the question: does this feel right to you?

Tie-in: Faculty's stated worry is students outsourcing the thinking. The role split is the countermeasure: the AI-facing role never makes the final call – a person does, on the record.

Human contribution moment: Subject authority: the student is the only one in the room who can tell where the reconstruction is shallow, out of order, or missing what a real practitioner would never leave out.

Share format: Walk the room through one part of the experience, then one thing AI got wrong that subject knowledge caught. Must work in a virtual classroom: screen-share plus one line in chat.

Entry point – required: a laptop and the topic already being taught. Not required: any coding, any prior AI experience, any paid tool or account. Participants use an institutionally approved AI tool of their choice.

Pacing flexibility – if short: halve the "Playtest a neighbour's" phase and cut sharing to three volunteers, everyone else submits one line. Never cut phase 2 ("First build pass") or the reflection. If energy is high: add a second playtest round with a naive audience brief: does it still teach the thing when the reader knows nothing?

== PHASES (this brief is written for 50 min; 50 / 75 / 90 columns given so the design system's 50-75 toggle can be built directly) ==

1. Set the world – 50min: 8 | 75min: 12 | 90min: 14 – facilitator function: Choose the moment and the person whose view the experience takes.

participant task: Choose whose experience the journey follows, and the exact moment it starts.

[no unlock word; opening phase]

2. First build pass – 50min: 10 | 75min: 15 | 90min: 18 – facilitator function: Have the AI generate the setting from inside the scenario.

participant task: Have AI generate the journey from inside that person's day – not a summary about it. [unlock word: build]

3. Depth pass – 50min: 14 | 75min: 20 | 90min: 24 – facilitator function: Push for detail, and correct what the AI got wrong.

participant task: Push for specific detail. Correct what is wrong, and log every correction.

[unlock word: deeper]

4. Playtest a neighbour's – 50min: 10 | 75min: 16 | 90min: 20 – facilitator function: Move through another team's experience and flag what rings false.

participant task: Walk a neighbouring team's journey and flag what rings false in theirs.

[unlock word: playtest]

5. Walk and reflect – 50min: 8 | 75min: 12 | 90min: 14 – facilitator function: Guide the room through one moment, and one correction.

participant task: Guide the room through one hour, and one correction you made. [unlock word: reflect]

== AI SKILL MOMENTS (what the facilitator watches for) ==

1. Phase 2, when a team asks the AI **about** the topic instead of **from inside** it -> skill:

Prompting from inside a scenario -> facilitator move: Show the difference live: "describe the ward" versus "you are the charge nurse at 6am, walk me through it." One line, whole-room.

2. Phase 3, the first correction a team makes to the AI's world -> skill: Using subject knowledge as the accuracy check -> facilitator move: Have them log it. The correction log is the evidence they understood the subject, not the build.

3. Phase 4, playtesting, when a team spots what a neighbour missed -> skill: Recognising plausible-but-wrong detail -> facilitator move: Ask how they knew. The answer is always experience – say so.

== ROLES (teams of 4, each with a named deliverable) ==

1. Builder – owns the running order: what happens, in what sequence

2. Prompter – owns the prompt log, and keeps the AI generating from inside the scene

3. Fact-holder – owns the correction log: every detail AI got wrong

4. Guide – owns the walkthrough that takes the room through it

== REFLECTION ==

1. Where did the AI give you richness you could not have built alone?

2. Where was it too shallow or plain wrong, and how did you know?

3. Name what the AI produced and what you decided. Which of the two mattered more to how this turned out?

4. Where in your own work or study, in the next two weeks, could you use this exact move?

Closing stem, every participant completes aloud or in writing: "The most useful thing I learned about working with AI today was ____, and I could use this when ____."

== BUILD NOTES ==

Session slug: networking (broadcast channel snhu-networking-room, localStorage key snhu-networking-proto)

Timing map: use the 50 and 75 columns above as the t50/t75 proportional map required by the design system. The 90-minute column is faculty-facing planning only – do not add a third toggle.

Run the framework's quality checklist before you finish, including the AI Quests-specific checks and both baseline pillar checks.

Then produce: (A) the tool-agnostic session HTML, (B) a tool-specific version only if a named tool's capability would meaningfully change the activity, and (C) the build instructions that reproduce it.
