

Nothing on this sheet is about AI. Answer it the way you would describe your course to a colleague — the tag, the timings, the roles and the built-in teaching moments get worked out from your answers. **SNHU AI Labs** are short, project-based workshops where students use AI to build something real and leave with a skill that lasts; every Lab is tagged by the artifact they create.

1 Your class

Course or class

The one topic or unit this Lab sits in

Subject

Sets the language the finished Lab is written in. It does not affect which kind of Lab you get.

- | | |
|--|---|
| ☐ Accounting & Finance | ☐ Education & Teaching |
| ☐ Business & Management | ☐ Psychology & Sociology |
| ☐ Marketing, Sales & Communication | ☐ Justice, Law & Public Policy |
| ☐ Analytics & Data | ☐ History, English & Writing |
| ☐ Computing & Software | ☐ Design & Media Arts |
| ☐ Cybersecurity & IT Infrastructure | ☐ Natural & Health Sciences |
| ☐ Game Design & Interactive Media | ☐ Mathematics & Physics |
| ☐ Engineering & Construction | ☐ Other or interdisciplinary |

What do you do in class on this topic right now?

Lecture, practice problems, case study, discussion. The Lab will add a layer rather than repeat this.

2 What kind of thing is this topic?

The most important answer on this sheet — it decides the shape of the activity. Tick one.

- | | |
|--|---|
| ☐ Done correctly or incorrectly — a technique, a calculation, a standard to apply, a tool to operate | ☐ Understood or argued about — a body of knowledge, a text, a historical event, a population |
| ☐ Navigated by people — a situation, a live interaction, a workflow, a judgment call | ☐ Built or designed — a brief, a working build, a spec, a plan, a system, a required document |

Then write the specific one: _____ (the digital Session Sketch splits these four into eighteen)

3 What students have in front of them

The raw material. It decides how the Lab opens and what the first ten minutes look like.

- | | |
|--|--|
| ☐ A dataset, results, or records | ☐ A process or procedure with steps |
| ☐ Documents, written sources, or literature | ☐ Something made — designs, images, code, creative work |
| ☐ A real case — a person, client, or customer situation | ☐ Competing claims, arguments, or positions |

4 Three questions, three different axes

What students should be able to do, who the work is for, and what actually goes wrong now. These refine what your content has already said rather than deciding it. Tick one in each.

By the end, what should students be able to do differently?

- ☐ **CR** — Make something they did not think they could make
- ☐ **CP** — Hold their own against a rival or a deadline
- ☐ **RE** — Tell sound work from unsound work
- ☐ **SI** — Understand the situation from the inside

Who is the thing they walk out with actually for?

Every answer is a person, and the person decides the tag.

- ☐ **CR** — A client, or a future employer — someone who wants the work itself
- ☐ **CP** — A judge, a panel, or the other team — someone deciding who did better
- ☐ **RE** — Someone who has to act on it and needs to know it is right
- ☐ **SI** — A learner — someone who understands it only by going through it

What goes wrong most often in student work on this topic?

Answer from grading, not from theory.

- ☐ **RE** — It is wrong, and they did not check
- ☐ **CR** — It is correct but generic — it could be anyone's
- ☐ **CP** — It reads fine on paper, but they would struggle to do it for real
- ☐ **SI** — It is accurate, but they cannot picture where this actually happens

5 The things only you know**Does this work involve competing — for a deal, a contract, a client, a place, or against a deadline?**

Only the last option rules a Compete Lab out.

Do your students bring lived or professional experience to this topic?

THE TWO MOST VALUABLE ANSWERS ON THIS SHEET**Name one mistake about this topic that only someone who knows the field would catch.**

What makes you wince when a student submits it? This exact mistake gets planted in the Lab. Nothing builds without it.

How would a student catch it?

- ☐ By running it and seeing the result is wrong
- ☐ By watching the consequence play out
- ☐ By checking it against a source or standard
- ☐ By losing to someone who got it right
- ☐ By knowing the field well enough to wince

What worries you most about students using AI on this topic?

- ☐ It sounds right but is wrong
- ☐ It skips or invents sources
- ☐ It is generic and flattens their voice
- ☐ They let it do the thinking

If students remembered one thing a year later, what would it be?**Anything the Lab should avoid? (optional)**

A **Lab** is any SNHU AI Labs session; the tag says what kind. Your topic kind, your raw material, and how the mistake gets caught do most of the deciding — the three questions on page 2 refine it.

6 The four tags

TAG	WHAT STUDENTS DO — AND THE ACTIVITIES THAT FIT	THEY WALK OUT WITH
CR · Create Making	Use AI to make something tangible, then push past its generic first attempt with their own knowledge. Pick one: the real professional deliverable · an explainer for outsiders · a weak version and a strong one, compared	A finished, shareable piece of work — plus the prompt that changed it.
RE · Research Verifying	AI answers fluently and confidently; students verify it against something real. The error is planted, not hoped for. Pick one, by what they verify against: Execute and Verify — run it and watch it fail · The Data — cleaning is the verification · The Source — trace to a primary origin · Your Expertise — catch AI wrong in your field · AI as Investigator — hunt a planted flaw	A conclusion plus its evidence trail — never a summary.
CP · Compete Racing or rivalry	Go head to head with a rival, or race a real clock, with AI driving the pace and the score. Pick one: head-to-head negotiation · a pitch-off · race to working · the adversarial pair · an incoming queue · a shrinking window	A decision log — every call made under pressure, and why.
SI · Simulate Exploring	Build an experience someone else can step into. Depth of understanding shows immediately. Pick one: an hour-by-hour journey · one scene in full detail · a branching path with consequences	A navigable scenario another person can learn from.

7 The quick read on your answers

IF YOUR TOPIC KIND WAS...	...THE TAG IS USUALLY
A technique, calculation, or standard	Research — and if students catch the mistake by running it, Execute and Verify
Built or designed	Create — unless the point is that it runs and is silently wrong, which is Research
Navigated by people	Simulate — or Compete if there is a rival or a real clock
Understood or argued about	Research — or Simulate for a historical moment students step into

TWO RULES THAT OVERRIDE ANY OF THE ABOVE

No rival and no clock, no Compete. A countdown bolted onto a verification activity is decoration — if the audit survives without the timer, it is Research. And **if the artifact is for someone else to move through, it is Simulate, not Create:** a Create artifact is for the maker, a Simulate artifact is for a learner.

IF IT IS NOT READY YET

Two things stop a Lab from building, and both are two minutes of conversation: no planted error, or a topic that is still a whole unit rather than the single thing students most often get wrong. Fix either and it builds.

Every Lab runs on any AI tool a student already has — approved tools only, no real client or personal data — and states in writing what AI produced versus what the students decided.
